

FRONT-END DEVELOPER - UI/UX DESIGNER

CAM HUYNH PHAN

I believe an interface should be felt, not just used – and I chase that feeling in every pixel, every interaction, and every screen I get to shape. For me, front-end development and design aren't separate disciplines; they're two sides of the same craft.

2011 – 2016

Da Nang University of Technology

Front-end Team Leader / UI/UX Designer

Led and grew a front-end team delivering production web applications in Angular and React for international clients, from architecture decisions to code review standards. Also acted as the company's UI/UX and branding lead – designing interfaces in Figma, defining the visual identity, and shaping the corporate website – so design and engineering decisions stayed consistent across every project the team shipped.

Angular Team Leader

Managed a team of Angular developers building enterprise-grade web applications for outsourcing clients, from technical architecture through delivery. Set coding conventions and reviewed pull requests to keep quality consistent across the codebase, coordinated sprint planning with product owners, and mentored junior engineers as the team scaled.

Java Developer

Built and maintained backend services in Java for outsourcing clients, working within an agile team to implement features, fix defects, and write unit tests. This role gave an early grounding in server-side logic and database design that later shaped how I approach full-stack collaboration as a front-end lead.

Bachelor of Information Technology

Studied software engineering fundamentals – data structures, algorithms, databases, and object-oriented design – with a growing focus on web development in the final years, which set the direction for a front-end-focused career afterward.

SKILLS

CODING

CORE

HTML / CSS / JavaScript

The foundation underneath every project across the career – semantic markup, responsive layout with Flexbox/Grid, and vanilla JavaScript for DOM work and browser APIs, still reached for directly whenever a framework would be overkill.

Flutter

Built cross-platform mobile apps end to end – UI, state management with Riverpod and Provider, and native integrations like offline storage and push notifications – on client projects such as HallyuClass and NGK Spark Plug, through to App Store and Google Play release.

Angular

Primary framework for enterprise applications – component architecture, RxJS, and state management with NgRx and NGXS. Used from Enouvo through Infostatus to lead front-end teams on real-time platforms like DTI and multi-client products like the Staff Management System.

Astro.js

Used for building fast, static-first marketing sites straight from Figma designs – content-driven pages and Tailwind CSS integration – shipped for the Infostatus website and this portfolio.

FAMILIAR

Next.js

Comfortable with server-rendered React basics – routing, data fetching, and SSR/SSG – applied on smaller-scope or personal projects rather than production client work.

Node.js

Basic scripting and simple APIs, used only in personal projects to experiment with backend logic and build tooling – not part of client delivery work.

OTHERS

FirestoreAWSCodemagic / CI-CD

AI TOOLS

Claude Code

Daily driver for hands-on engineering work in the terminal – writing and refactoring code, debugging, running project-wide changes, and automating repetitive tasks like content updates and data syncing.

ChatGPT / Prompt Engineering

Used for research, planning, and content writing – structuring prompts with clear context and constraints to get focused, usable output instead of generic answers, across tasks from technical research to copywriting.

GitHub Copilot

In-editor autocomplete used daily to move quickly through boilerplate and repetitive patterns, freeing up more time for architecture decisions and code review.

FEATURED PROJECTS

DTI

Front-end Team Leader & Project Manager

8 Members

A monitoring and operations system for tram services in Melbourne, Australia.

TECH

AngularMaterial DesignOpenStreetMapNgRx

Angular formed the backbone of the app, styled with Angular Material for a clean, consistent interface. A WebSocket connection kept vehicle positions and incident data flowing in real time straight onto the map, which was built on OpenStreetMap and customized to match the product's visual language. NgRx tied it all together, keeping state predictable as data streamed in continuously from across the tram network.

ROLE

Served as technical lead and primary front-end developer, translating the client's operational requirements into a scalable Angular architecture. Acted as the main point of contact with the Australian client for solution alignment and release planning, managed the project roadmap, and mentored new members joining the 8-person team.

Staff Management System

Front-end Team Leader

5 Members

An in-house HR management system built by Enouvo and sold to multiple clients.

TECH

AngularCoreUIChart.jsNGXS

Angular paired with CoreUI gave the interface a clean, enterprise-ready feel across every client configuration. Chart.js brought the dashboards to life with attendance and payroll trends at a glance, while NGXS kept state management lean and predictable as the same codebase flexed to fit each client's needs.

ROLE

Directed a 5-person front-end team in designing a single codebase that could be configured per client rather than forked and rebuilt each time. Defined the module structure and coding standards that kept the shared codebase maintainable as more clients came on board, and worked directly with client stakeholders to scope customization requests before implementation began.

Investor Zero

Front-end Team Leader & UI/UX Designer

6 Members

A startup platform helping first-time investors put together pitches and raise funding online, connecting founders with early-stage backers.

TECH

AngularPrimeNgAngular UniversalNGXSPDF.js

Angular and PrimeNG formed the foundation of the UI, fast to iterate on as product priorities shifted week to week. Angular Universal added server-side rendering for fast first loads and better SEO, NGXS kept state manageable through rapid MVP changes, and PDF.js powered in-browser document viewing and e-signatures – letting founders and backers review and sign pitch documents without ever leaving the app.

ROLE

Led a 6-person front-end team through the startup's MVP phase, where priorities shifted week to week and speed mattered as much as quality. Worked directly with the founder to turn early product ideas into shippable features, iterating the UI/UX design based on user feedback while keeping the Angular front-end structured enough to support fast changes.

PayLocker

Front-end Team Leader & UI/UX Designer

5 Members

A startup platform built by Infostatus that connects contractors and homeowners to manage payments and construction progress with full transparency for both sides.

TECH

AngularPrimeNgTailwindCssSumsud SDK

Angular, PrimeNG, and Tailwind CSS combined to give contractors and homeowners an interface that felt clear and trustworthy at every step. State flowed through Angular services paired with signals for fine-grained reactivity, and the Sumsud SDK was woven in to handle KYB/KYC verification, keeping both sides of every transaction accountable.

ROLE

Owned the payment and construction-progress tracking flows end to end, from wireframes to production UI, designing them to stay clear and trustworthy for homeowners with no construction background. Set the Angular front-end architecture for the wider product, mentored newer members of the 5-person team, and stayed accountable for the overall quality bar as the product moved from MVP to a client-facing release.

HallyuClass

Mobile Developer

3 Members

An online Korean-learning app for beginner-to-advanced learners, combining structured lessons, vocabulary practice, and progress tracking.

TECH

FlutterRiverpodGoogle SpeechCodeMagic

Flutter Material shaped a clean, lesson-friendly interface, with Riverpod keeping state predictable across screens. A WebSocket connection streamed learners' voice recordings to the server and back in real time, powering a Google Speech-driven pronunciation feature that gave instant feedback on Korean pronunciation. Codemagic handled CI/CD end to end, automating builds and releases straight to the App Store and Google Play.

ROLE

Built the app end to end in Flutter as part of a 3-person team, from the first screens through release, including setting up the build pipeline and publishing to the App Store and Google Play.

NGK Spark Plug

Mobile Developer

4 Members

An internal inventory app for a Japanese client, tracking electronic components on a spark plug production line at a factory to reduce manual counting errors.

TECH

FlutterFirebaseProviderSafeliteCodeMagic

Flutter Material kept the interface simple and functional for factory-floor use, with Provider managing state throughout the app. Safelite gave the app offline-first local storage, so staff could keep counting components even through patchy factory Wi-Fi, while Firebase Cloud Messaging pushed real-time alerts the moment they were needed. Built strictly for internal use, the app shipped as Ad Hoc builds distributed through Codemagic rather than published to the public app stores.

ROLE

Worked as part of a 4-person team embedded with a Japanese client, building the component-tracking app in Flutter against tight factory-floor requirements. Handled QA cycles directly with the client and coordinated release timing to the App Store and Google Play around production schedule constraints.

Infostatus Website

Front-end Developer

1 Member

The corporate website for Infostatus, an Australian software consultancy – built end to end from Figma designs to a live production site.

TECH

AstroTailwindCssAWS AmplifyCloudFrontRoute 53

Astro paired with Tailwind CSS delivered a fast, static-first site built directly from Figma design specs, with every section translated into responsive, pixel-accurate components. Deployment ran through AWS Amplify, with CloudFront and Route 53 configured to serve the site through a CDN under the company's custom domain.

ROLE

Owned the project end to end: converted the Figma designs into a fully responsive Astro site, and set up the AWS deployment pipeline, including the Amplify build, CloudFront distribution, and Route 53 DNS configuration for the custom domain.

Agntic

Research & Founding Member

3 Members

An AI platform that lets users build and customize AI agents for their own purposes through a conversational interface, rather than technical configuration.

TECH

FlowiseAILLM Orchestration

Built on top of FlowiseAI, an open-source low-code framework for orchestrating LLM workflows and agents, extended and customized to fit the product's agent-building and deployment flow.

ROLE

Joined at the earliest stage of the project, researching the feasibility of building a no-code AI agent platform on top of FlowiseAI and helping shape the initial product direction and architecture as one of the founding members.

BRANDING DESIGN

Infostatus Branding

Brand & Logo Designer

1 Member

Brand identity for Infostatus, an Australian software consultancy – logo and marketing banners carrying a consistent visual identity across the website and marketing materials.

TOOLS

Illustrator

Designed the Infostatus logo and a set of marketing banners in Adobe Illustrator, translating the brand's visual identity into consistent, reusable assets later carried through to the company's website.

ROLE

Designed the Infostatus logo and related marketing banners, defining the visual identity that shaped the company's brand presence across its website and materials.

Agntic Branding

Brand & Logo Designer

1 Member

Brand identity for Agntic, an AI agent-building platform – logo and marketing banners designed to reflect the product's AI-forward positioning.

TOOLS

Illustrator

Designed the Agntic logo and marketing banners in Adobe Illustrator, shaping a visual identity that reflected the product's AI-agent positioning across the site and marketing assets.

ROLE

Designed the Agntic logo and related marketing banners as part of the project's founding work, establishing the initial visual identity for the platform.
